Team Motivation

## Business intelligence and decision support

By definition a digital dashboard is an application that brings business intelligence and decision support to the forefront of the people in an organization who can manage the exceptions that it shows. Essentially, a digital dashboard is part of a total portal solution for your management team.

The digital dashboard can be configured to share whatever metrics you want to make available to the person who is viewing the information. Most often, a digital dashboard is used to manage the exceptions of the business so that through specific alerts the team can take corrective action in an efficient manner.

### Well-implemented dashboards will:

- Assist personnel in adhering to strategic goals set by management
- Bring added agility to your organization by delivering timely information to users in decision-making roles
- Facilitate the identification and elimination of resource and cost inefficiencies
- Be extensible enough to accommodate the evolving needs of your business.

We have to admit when we look at the dashboard in our cars, it's often because we are looking to see if something is wrong. The police officer is looking at me funny. How fast was I driving? Do I have enough gas to get me to where I am going? I am looking for exceptions, warning lights. Just as my car dashboard gives me an indication if something is wrong or confirmation that everything is OK.

Axisware's breed of digital dashboards can display your critical business indicators to you delivered by various technologies such as Web Based Portals, Public Display Systems, Desktop Widgets or simply delivered to your desktop pc.
